## [13] xfun_0.3        stringr_1.3.1   digest_0.6.16   evaluate_0.11
```

Problem 1

If Build window warning

```
missing Loadname() 'package name'
```

just use the code

```
install.packages("package_name")
```

Sometimes the package is not available in RStudio. Just google it and follow the process in relevant github web page.

Problem 2

If Build window warning missing "pandoc" or "XQuartz", go to the website shown in the warning and install it.

Problem 3

If your Console warns "unknown timezone" or something relevant, you need to go https://cran.r-project.org/bin/macosx/ and install R 3.5.1.

Problem 4

If Build window shown warning of missing font style, just google it, then download and install it.

Problem 5

If the _main.pdf has been created and these words are shown in Build window,

```
Output created: _book/_main.pdf
Warning messages:
1: The label(s) function-answer not found</span>
2: The label(s) functional-arguments not found
3: The label(s) prefix-form not found
4: The label(s) varying-argument not found
```

it means you did good job and building is finished.
